

Database Programming with SQL

16-1: Working with Sequences

Practice Activities

Objectives

- List at least three useful characteristics of a sequence
- Write and execute a SQL statement that creates a sequence
- Query the data dictionary using USER_SEQUENCES to confirm a sequence definition
- Apply the rules for using NEXTVAL to generate sequential numbers for use in a table
- List the advantages of caching sequence values
- Name three reasons why gaps can occur in a sequence

Vocabulary

Identify the vocabulary word for each definition below.

Command that automatically generates sequential numbers
Generates a numeric value
Returns the next available sequence value
Specifies the interval between sequence numbers
Specifies a maximum value of 10^27 for an ascending sequence and -1 for a descending sequence (default)
returns the current sequence value
specifies the minimum sequence value

specifies whether the sequence continues to generate values after reaching its maximum or minimum values
specifies a minimum value of 1 for an ascending sequence and – (10^26) for a descending sequence (default)
specifies a maximum or default value the sequence can generate
specifies the first sequence number to be generated
specifies how many values the Server pre-allocates and keeps in memory

Try It / Solve It

- 1. Using CREATE TABLE AS subquery syntax, create a seq_d_songs table of all the columns in the DJs on Demand database table d_songs. Use the SELECT * in the subquery to make sure that you have copied all of the columns.
- 2. Because you are using copies of the original tables, the only constraints that were carried over were the NOT NULL constraints. Create a sequence to be used with the primary-key column of the seq_d_songs table. To avoid assigning primary-key numbers to these tables that already exist, the sequence should start at 100 and have a maximum value of 1000. Have your sequence increment by 2 and have NOCACHE and NOCYCLE. Name the sequence seq_d_songs_seq.
- 3. Query the USER_SEQUENCES data dictionary to verify the seq_d_songs_seq SEQUENCE settings.

4. Insert two rows into the seq_d_songs table. Be sure to use the sequence that you created for the ID column. Add the two songs shown in the graphic.

ID	TITLE	DURATION	ARTIST	TYPE_CODE
	Island Fever	5 min	Hawaiian Islanders	12
	Castle of Dreams	4 min	The Wanderers	77

- 5. Write out the syntax for seq_d_songs_seq to view the current value for the sequence. Use the DUAL table. (Oracle Application Developer will not run this query.)
- 6. What are three benefits of using SEQUENCEs?
- 7. What are the advantages of caching sequence values?
- 8. Name three reasons why gaps may occur in a sequence?

Extension Exercise

- 1. Create a table called "students". You can decide which columns belong in that table and what datatypes these columns require. (The students may create a table with different columns; however, the important piece that must be there is the student_id column with a numeric datatype. This column length must allow the sequence to fit, e.g. a column length of 4 with a sequence that starts with 1 and goes to 10000000 will not work after student #9999 is entered.)
- 2. Create a sequence called student_id_seq so that you can assign unique student_id numbers for all students that you add to your table.
- 3. Now write the code to add students to your STUDENTS table, using your sequence "database object."
